

Application: Application: Aplicación:

Mazda 3

Location of cabin filter:

Under the dash on the passenger side of the vehicle

Tools:

Phillips-head screwdriver

To remove existing filter:

1. Look under the glove box and remove the plastic panel above the foot well. It is held in place by two clips nearest to the seat. The plastic panel may also have some lighting hooked to it if so un-clip that also.
2. Next pop out the center console panel. Do this by gently prying from the side closest to the shifter and slide it back towards the shifter once the clips are out.
3. Where you removed the center console panel, you should see the cabin filter cover. Remove the three Phillips-head screws securing the cover and remove the cover.
4. Remove the first filter by sliding the bottom filter out. Remove the second or top filter by sliding it out also.
5. Put the new filters in the housing so they stack like the filters you removed.
6. Replace the cabin filter door and replace the screws that secure it.
7. Replace the center console panel.
8. Replace the plastic panel above the foot well.
